

MODIFYING A SAS PROGRAM

In what follows it is described how to modify a SAS program file that is posted on Husky CT site of the course for analyzing the data in Example 3.1 that is described on page 64 in the textbook. You can copy the SAS programs posted on Husky CT with highlighting and then right click with you mouse and choose copy, or by clicking simultaneously the keys on your keyboard Ctrl + V. In the SAS window named “Editor – Untitled”, right click paste to import the SAS program file. For example, you can import the SAS program file: SAS file no 2 Syfiber data. Once you have this file in the SAS Editor window you can start modifying it. First you can change the Title statement to:

```
TITLE 'Plasma Etching';
```

The you should give a new name to the data:

```
DATA PLASMA;
```

Next, in the INPUT statement you have to give names for variable in the data, for example:

```
INPUT POWER ETCHRATE @@;
```

the next SAS command is:

```
CARDS:
```

Now you have to type in the data for Example 3.1, using the order of the variables in the INPUT statement.

```
160 575 160 542 160 530 160 539 160 570  
180 565 180 593 180 590 180 579 180 610  
200 600 200 651 200 610 200 637 200 629  
220 725 220 700 220 715 220 685 220 710  
;
```

The PROC GLM statement remains the same!

```
PROC GLM PLOTS=(DIAGNOSTICS);
```

In the class statement you need to list the variable related to the treatment levels:

```
CLASS POWER;
```

Next comes the MODEL statement that has the response variable to the left of the equal sign and the treatment or class variable to the right of the equal sign:

```
MODEL ETCHRATE=POWER;
```

Now comes the MEANS statement for the treatment variable:

```
MEANS POWER/TUKEY LINES;
```

The last four SAS program statements remain the same. No changes are needed!

To run the SAS program you click on the running person icon.
